GRAF – Setting standards in quality

For 50 years, Otto Graf GmbH has been offering high-class plastic products to its customers. In 1974, GRAF developed its first pioneering range of rainwater harvesting products. Today we are market leader in numerous countries for Rainwater Harvesting Systems.

High Quality Manufacturing

Graf is investing continuously in the expansion of the headquarters in Teningen near Freiburg (Breisgau). The facility has now an approximate area of 155.000m² and is one of the most modern production facilities for plastic products in the world.

Our choice of Germany for the new production site was easy. On the one hand, we feel an obligation to the site because of our history. On the other, we would like to offer our customers products of the highest quality.

Quality is at the forefront

To ensure consistent high product quality, you need optimised production processes and outstanding quality management. Every individual tank at the new production site in Teningen is checked for dimensional accuracy, wall thickness and weight.

All production parameters, e.g. material composition, machine settings and the staff involved in the production process, are documented for each individual product.

Our goal: your satisfaction

More than 100,000 satisfied customers already benefit from the advantages of GRAF rainwater harvesting systems.

Manufacturing certified according to ISO 9001

High Quality Manufacturing

Our products have to satisfy a huge number of different requirements, which is why GRAF is an expert in all the common procedures for manufacturing plastic products and has access to the optimum manufacturing process for every product.

Ecological products from the technology leader

GRAF uses state-of-the-art production facilities. This is the only way to guarantee superlative quality at attractive prices. GRAF broke new ground by using injection embossing to make the Carat underground tank. To manufacture this tank, the company developed and constructed the world's largest injection moulding machine.

Durable and 100% recyclable

Right from the stage of developing its products, GRAF attaches great importance to sustainable product design.

Long product lives ensure that fewer resources are used and the environmental impact is minimised. All products manufactured by GRAF are 100% recyclable.

Some products are also made from recycled materials – yet another boost to the environmental credentials of the GRAF product range. This means that not only do GRAF products protect the environment during use but their manufacturing process is also ecologically sound.

Sustainable production processes

While GRAF products help protect the environment, they are also manufac-

ured in an environmentally-sound way. For example, the injection moulding process consumes up to **85% less energy** than normal.

The heat generated during manufacturing is processed by a modern heat recovery system and is used to heat the production and logistics building.

Basic information/Dimensioning

Preserving the natural cycle

Surface sealing **disrupts** groundwater recharge

Decentralised infiltration **promotes** groundwater recharge

Legal change

With the adoption of the European Water Framework Directive (2000/60/EG), the European Parliament has set the goal of using water more sustainably and in a more environmentally friendly way. The European states will be responsible for implementing this directive.

The Water Resources Acts of most European countries will therefore be amended. The implementations can be found in many current versions – among others:

"rainwater should be drained away and irrigated locally ..., as long as this is not opposed by water legislation, other provisions of public law or water management issues."

The infiltration of rainwater locally offers considerable advantages over the previously customary draining into combined wastewater/separate sewage systems:

- Promotes groundwater recharge
- Reduces costs through lower structural costs – sewers in the separate network and wastewater lifting units can be dimensioned on a smaller scale
- Reduces the effects of surface sealing
- Minimises the hydraulic loads in the sewer system during storms
- Contributes to flooding prevention

Dimensioning and planning of infiltration systems

The following parameters are required to evaluate an infiltration system:

✓ **Determination of the catchment areas**

Connected roofs, road spaces or other sealed surfaces are evaluated with regard to the actual outflow.

✓ **Examination of the ground**

Determination of the permeability of the ground (k_f value in m/sec). This value plays a decisive role and a miscalculation can have far-reaching consequences.

✓ **Return period**

An infiltration or retention system is designed as a function of heavy rainfall events that are likely to occur over a given period of time. This period of time may vary from 5 to 100 years due to local government laws and regulations. Most of the calculations are done with 5 year rain data.

Determination of the catchment areas

The collected rainwater can be fed into ditches and drained away from roof surfaces, parking areas, paving and other sealed surfaces. Evaporation and the partially direct infiltration through the collection surfaces result in a reduction of the amount of rain that ends up in the infiltration system. This leads to differing outflow coefficients for the connected surface types (see table below). The projected surfaces are relevant for the evaluation of the amount of rain and may deviate substantially from the roof surface, particularly in the case of sloping roofs.

The effectively impermeable surface for ditch evaluation can be evaluated using the outflow coefficient and the catchment area

Type of surface

Roof surfaces (95%)

Concrete blocks (90%)

Natural/composite stone (25%)

Turf (10%)

Asphalt and concrete (90%)

Paving with sealed joints (75%)

Paving with open joints (75%)

Gravel path (30%)

Examination of the ground

The ground conditions and the layer structure play an essential role in the planning of an infiltration system. The permeability of the ground and the ground/stratum water define the size and location of the ditch. A soil report should at the least include window sampling or trenching near the installation location for the evaluation of the infiltration performance. In addition, information or evaluations for the construction

of an infiltration system can be found in most soil reports. The result of the window sampling or trenching is a layer model which depicts the ground types and their distribution and thickness down to the digging depth. Infiltration systems must not be installed in layers, with permeability of $< 1 \times 10^{-6}$ m/s (clay or cohesive soil with high clay capacity). However, the ground may display a maximum permeability of $\leq 1 \times 10^{-3}$

m/s, since a minimum retention period should be achieved in the soil layers before entry of groundwater.

If the ground properties do not permit infiltration, the required k_f values can be achieved using soil replacement in special cases.

Recommended permeability values:

Soil type

Soil type	Suitable soil for infiltration		
	weak	medium	strong
Coarse gravel			—————
Fine gravel			—————
Gravel/sand mix			—————
Medium sand			—————
Fine sand			—————
Sand with a loam capacity			—————
Silt (loam)			—————
Loam with a clay capacity			—————
Clay	—————		
Permeability values	weak	medium	strong

Return period

The size of an infiltration or detention system depends on heavy rainfall events which occur over a given period of time. This period of time may vary from 5 to 100 years due to local government laws and regulations. Most of the calculations are done with 5 year rain data, see picture/table below.

Values given as an example:

D [min]	rain flow [l/sec*ha]	rain volume [l/100 m ²]
5	380.7	1142.1
10	245.6	1473.6
20	158.9	1906.8
30	123.4	2221.2
60	80.3	2890.8
120	47.8	3441.6
240	28.4	4089.6
540	15.5	5022
720	12.5	5400
1440	7.3	6307.2
2880	4.1	7084.8
4320	2.9	7516.8

In combination with soil type, the critical value (max. value for infiltration system dimensions) could lie between 5 minutes (good soil) and 4320 minutes (clay or loam).

GRAF EcoBloc Inspect flex

The third-generation GRAF infiltration and attenuation system

Twice the volume per truck

To save space during transport, two EcoBloc Inspect flex modules are stacked one inside the other. This halves transport costs and CO₂ emissions.

Easy to install

GRAF EcoBloc Inspect flex modules are easy to transport and install. The modular system structure requires few accessories.

Easy to inspect

The standard inspection channel allows the entire percolation system to be monitored effectively. The EcoBloc Inspect flex system allows access by commercially available inspection cameras. This has been confirmed by several independent testing authorities.

High pressure jetting possible

GRAF EcoBloc Inspect flex system can easily resist high pressure jetting.

205 l
(54.2 US gal.)

205 l
(54.2 US gal.)

25 l
(6.6 US gal.)

Highly flexible

Each EcoBloc Inspect flex module has a volume of 205 l (54.2 US gal.), an area of 800 x 800 x 320 mm (31.4" x 31.4" x 12.6") and a height of 320 mm (12.6"). The system size and load bearing can be adjusted individually to suit requirements of traffic and non-traffic areas.

Lorry-bearing up to 60 t

The GRAF EcoBloc Inspect flex has a heavy-duty lorry-bearing capacity of 60 tons with an 800 mm (31.4") earth covering.

Installation depth of up to 5 metres (16' 4.8")

Even under very heavy loads, GRAF EcoBloc Inspect flex system can be installed at a depth of up to 5 metres (16' 4.8"). This means that up to 14 layers are possible.

Connection up to DN 500 (20")

Large percolation volumes require large pipe cross-sections. This is not a problem for GRAF EcoBloc Inspect flex: it has DN 100 (4"), 150 (6") and 200 (8") connections on all sides. DN 100 (4") connections are positioned eccentrically at the side for complete deaeration. Larger connections of up to DN 400 (16") are available in conjunction with the Vario 800 flex, type 2. Connections of up to DN 500 (20") could be realised with GRAF adapter plates.

Designed for decades of use

A durable product design ensures sustainability. The GRAF EcoBloc Inspect flex is designed for a **service life of over 50 years**.

Universal use

For rainwater infiltration, detention, retention or rainwater harvesting

High percolation rate

The GRAF EcoBloc Inspect flex system is designed to have a high rate of percolation and barrier-free inspection.

GRAF Infiltration Tunnel / twin

The logistical miracle – can be laid in rows

Easy installation

The GRAF Infiltration Tunnels are laid in lines and can be flexibly adapted to specific conditions and to the individual storage volume requested. The installation of the modules is easy, quick and variable. The installation is possible without heavy equipment, as one Infiltration Tunnel only weighs 11 kilos. The tunnel modules are simply stuck together in one line and equipped with 2 end plates per line.

Infiltration Tunnel twin – Twice the volume with the same space requirement

Upon request, the Infiltration Tunnel twin 600 litres (158 US gal.) offers volume through the connection of two identical Infiltration Tunnel modules.

Up to 12,000 litres infiltration volume per pallet

Thanks to its special design, the GRAF Infiltration Tunnel can be stacked easily. Consequently, the shipment of up to 40 Infiltration Tunnels on one pallet saves considerable transport and storage costs.

- up to 500,000 litres per lorry
- 975 items per 40" HC container

300 l Volume

The compact dimensions combined with a storage coefficient of 100% result in a useful volume of 300 l (79 US gal.).

Lorry-bearing up to 60 t

In order to enable the free arrangement of surfaces above it, the Infiltration Tunnel features long-term resistance with 59 kN/m² (Infiltration Tunnel twin 35 kN/m²) and is therefore lorry-bearing.

100% storage volume

The typical shape of the Infiltration Tunnel enables complete utilisation of the available volume for the temporary storage of rainwater.

Connections up to DN 300 (12")

Large infiltration volumes require large pipe diameters. For the GRAF Infiltration Tunnel, this is not a problem: each end plate features connections in the sizes DN 100 (4"), 150 (6"), 200 (8") and 300 (12"). In addition, connections in the sizes DN 100 (4") and 200 (8") are provided on the upper surface for the connection of a ventilation system or an inspection opening.

High infiltration performance

The ditch elements are placed directly upon an even layer of gravel. The sides are then covered with geotextile and the end faces are closed using end plates. This installation and the side slats ensure a permanent high infiltration performance.

Installation depth of over 4 metres

The GRAF Infiltration Tunnel can be installed at a depth of up to 4.25 metres (13' 11"), even under heavy loads. The maximum installation depth for the Infiltration Tunnel twin is 2.5 metres (8' 2.4").

GRAF Vario 800 flex shaft system

for EcoBloc Inspect flex

Vario 800 flex – as flexible as your EcoBloc Inspect flex ditch

- Shaft can be fully integrated, therefore no additional excavation is required
- Various applications (e.g. as an inlet shaft, detention shaft or inspection shaft)
- Can be positioned in any location in the ditch grid
- Can be combined with proven GRAF covers and shaft components
- Connections via the inlet module can be rotated 360°
- Very good accessibility with 600 mm (23.6") clearance
- DN 200 (8") / 300 (12") / 400 (16") connection surfaces
- Shaft volume can be calculated into the assessment of the ditch volume

Shaft can be fully integrated

The Vario 800 flex shaft system can be directly installed in an infiltration or detention system with EcoBloc Inspect flex. The connection surfaces of the in-

spection channels in the Vario 800 flex shaft system are accurately matched to the EcoBloc Inspect flex system.

Can be positioned in any location

The dimensions of the Vario 800 flex shaft enable free positioning within the EcoBloc Inspect flex system. The corner position enables the connection of large

pipe diameters of up to DN 400 (16") on the two side panels. The central position offers ideal access to the inspection camera from all directions. Using the

optional inlet module, a connection of up to DN 300 (12") can be made with a freely defined angle.

Can be rotated 360°

Rainwater detention / retention

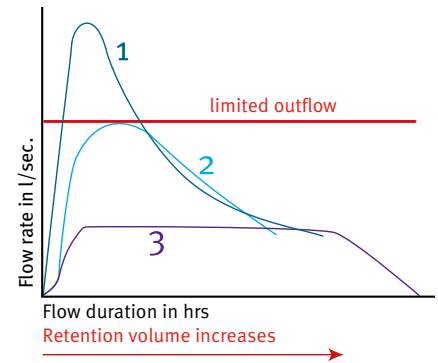

Rainwater detention and retention with limited outlet

Detention

Detention systems, i.e. rainwater detention, play an important role in the reduction of hydraulic peaks and thus help relieve strain on the public sewer network, particularly in new construction areas. Detention systems usually consist of a volume which is used for the temporary storage of rainwater in the event of heavy rainfall, and a throttling device to limit the draining runoff water. The rainwater is cleaned using a filter before it enters the detention volume in order to avoid compromising the function of the throttling device. The throttled flow of rainfall is fed into the sewer and the excess amount is retained in the deten-

tion cistern. This amount accumulates in the detention cistern and is also drained off with the throttled runoff water after the rainfall event. The detention volume is thus discharged and remains available once more as a temporary storage tank for the next rainfall event.

1. Outflow rate without throttle
2. Outflow rate with static throttle
3. Outflow rate with dynamic throttle

Retention

The GRAF retention cistern is a combination of rainwater retention and rainwater harvesting. The detention can be larger if required. In this case, part of the rainwater can also be used in addition to the required detention volume. For example, rainwater can be used for the following applications:

- Watering gardens
- Flushing toilets
- Washing machines
- Cleaning

The use of rainwater means that up to 50% of drinking water can be saved, and up to 85% for commercial properties.

The retention cistern is designed such that the rainwater first fills the usage volume. When the useful volume is full, the throttled outflow is activated and the detention volume also becomes available for temporary storage. The detention mechanism with throttled outflow in turn corresponds to a conventional retention system. Following the rainfall event, the position of the outflow prevents the detention cistern from being completely emptied, while the usage volume remains in the tank!

1. Outflow rate without throttle
2. Outflow rate with static throttle
3. Outflow rate with dynamic throttle

	Detention	Retention
Rainwater detention	✓	✓
Rainwater harvesting		✓

Rainwater detention with GRAF EcoBloc Inspect flex

In the event of heavy rainfall, a controlled discharge of rainwater to the sewer system is of increasing importance. The amount of rain from a storm is thus distributed evenly over a longer period of time. The GRAF EcoBloc

Inspect flex is enclosed in a three-layer structure, which prevents the uncontrolled drainage of water from the ditch. EcoBloc Inspect flex ditches to relieve the sewer system are generally provided with throttled drainage. These can be

integrated into the GRAF Vario 800 flex shaft system, among others. The position of the shaft can be freely defined.

Detention systems with GRAF EcoBloc Inspect flex

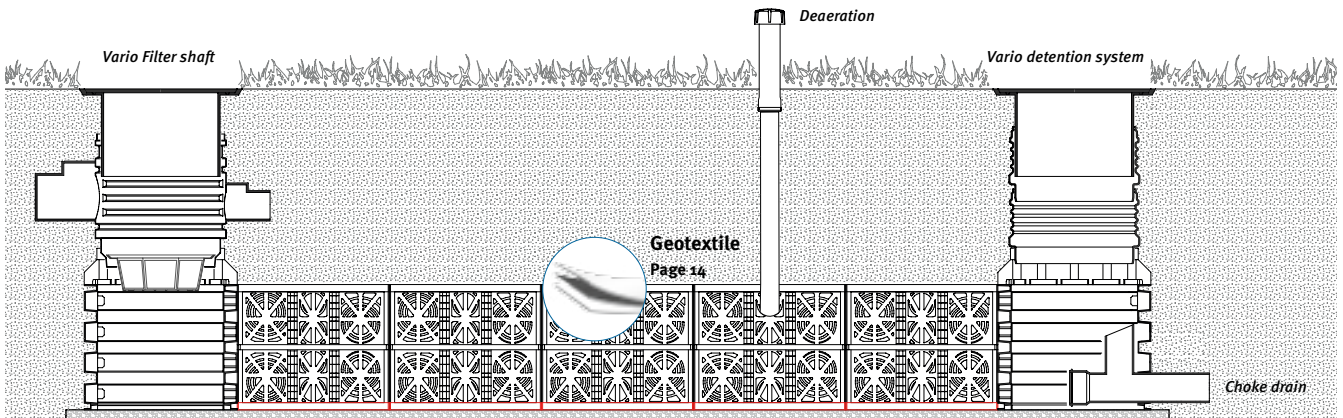

The detention volume required can be made up of tanks as well as ditch elements. The ditch elements are wrapped in geotextile. Next there is a watertight layer with an impermeable film of cor-

responding strength (tip: HDPE film, min. 2mm (0.08") thick). The two layers are once more wrapped in geotextile. The inner layer of geotextile protects the watertight film from sharp block edges,

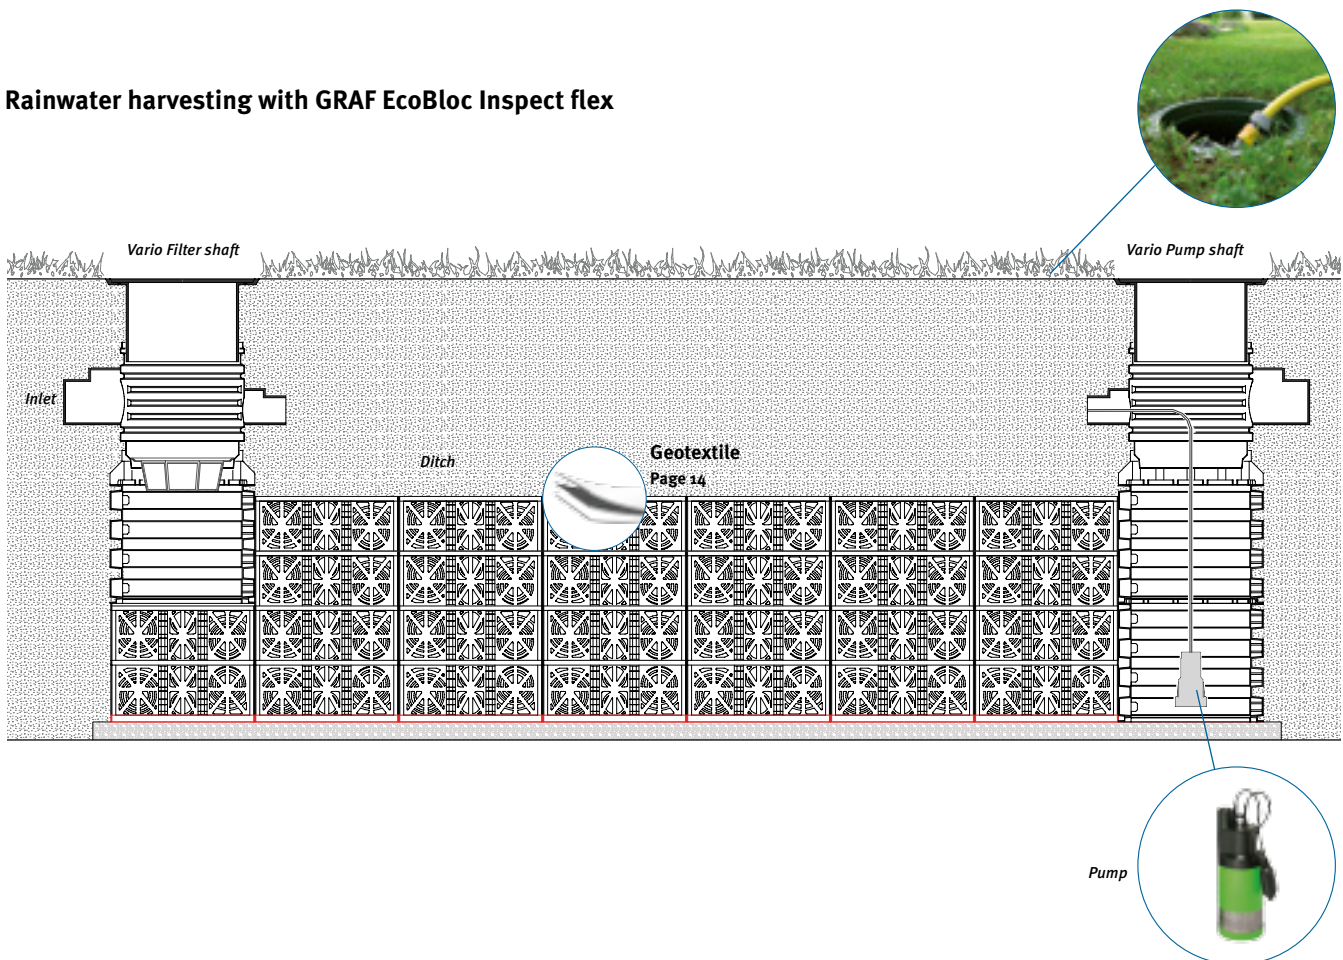

while the outer geotextile prevents damage from the surrounding earth or stones.

Detention with GRAF EcoBloc Inspect flex

up to 100,000 litres upon request
 *with a second tank dome

Technical data

max. axle load:	8 t
max. total weight:	3.5 t with cast iron cover, 40 t with telescopic dome shaft lorry
Earth covering with loading capacity:	800–1500 mm (2' 7.5"–4' 11")
Groundwater stability:	up to the middle of the tank
Earth covering with groundwater installation:	800–1500 mm (2' 7.5"–4' 11")
Connection options:	DN 100 (4")–DN 200 (8")

Herkules detention cistern

The detention cistern with unequalled value for money. Thanks to its patented design, the transport of the Herkules Infiltration tank is very easy. The two tank halves can be assembled on site, and the patented quick connection system enables easy, tool-free installation in just a few minutes. By using the interconnecting pipe sets, the system can be extended at will. Patent no. in Europe 0870877 and USA no. 587807

**1600 LITRES
(422 US GAL.)**

Technical data

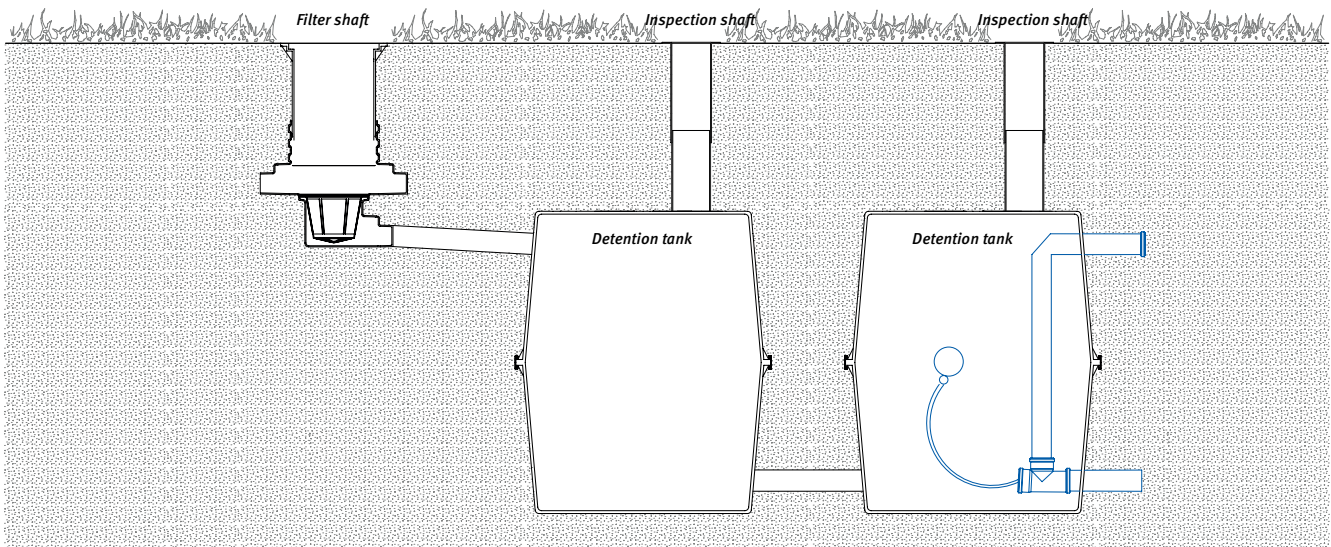

Volume	1,600 litres (422 US gal.)
Max Ø	1350 mm (53")
Height	1600 mm (63")
Material	fibre-glass reinforced PP (UV stable and 100% recyclable)
Weight	approx. 60 kilos
Connections	each 2 x DN 70 (2.8"), DN 100 (4") and DN 200 (8")

Herkules detention cistern

1600 litres (422 US gal.)
without support pipe

Order no. 320001

[Webcode G1301](#)

Practical advantages of Herkules

Ease of transport

Each half of the Herkules-Tank only weighs 30 kg. This allows ease of transport and manual installation. The tank halves fit through any doorway (80 cm width and above).

Easy to install

Several tanks can be combined

Herkules Infiltration tank

The Infiltration tank with unequalled value for money. Thanks to its patented design, the transport of the Herkules Infiltration tank is very easy. The two tank halves can be assembled on site, and the patented quick connection system enables easy, tool-free installation in just a few minutes. By using the interconnecting pipe sets, the system can be extended at will. Patent no. in Europe 0870877 and USA no. 5878907

Technical data

Volume	1,600 litres (422 US gal.)
Max Ø	1350 mm (53")
Height	1600 mm (63")
Material	fibre-glass reinforced PP (UV stable and 100% recyclable)
Weight	approx. 60 kilos
Connections	each 2 x DN 70 (2.8"), DN 100 (4") and DN 200 (8")

Herkules Infiltration tank
Including support pipe
Order no. 200201

Accessories for Herkules detention cistern and Herkules Infiltration tank

Cut-out tool (with pilot drill)

DN 70 (2.8")	Order no. 202002
DN 100 (4")	Order no. 202003

Interconnecting pipe set (without cut-out tool)

DN 70 (2.8")	Order no. 202029
DN 100 (4")	Order no. 202028

Tank dome

(with telescopic end 1 m (3.3') to be cut on demand)

DN 200 (8")	Order no. 322026
-------------	------------------

Support pipe for Herkules tank

required for underground assembly

DN 150 (6")	Order no. 322014
-------------	------------------

GRAF-Tex geotextile

For one Herkules Infiltration Tank

Order no. 369015

Material sold by the metre, roll width 5 m (15.2')

Order no. 231002

Further application possibilities

Rainwater harvesting solutions

The modular system Carat S

Choose your tank size

Carat S underground tank for vehicle loading

Size 2,700 – 6,500 litres (700 – 1,700 US gal.). Designed to be used in conjunction with the vehicle loading telescopic dome shaft. The access dome is designed in accordance to DIN testing.

Illustration shows 4,800 litre (1,250 US gallon) tank with telescopic dome shaft for pedestrian loading

Volume [litres]	Order no.
2,700 (700 US gal.)	372024
3,750 (1,000 US gal.)	372025
4,800 (1,250 US gal.)	372026
6,500 (1,700 US gal.)	372027

Tank dome Maxi

(page 54)

Order no. 371040

Tank dome Mini

Internal Ø tank dome	800 mm (31.5")			
Weight	120 kg (265 lbs.)	150 kg (331 lbs.)	185 kg (408 lbs.)	220 kg (485 lbs.)
Load				
Max. axle load	Suitable for vehicle loading			
Earth covering	800 - 1200 mm (31.5 - 47.2")			
Groundwater				
Groundwater-stable	Up to the middle of the tank			
Earth covering	800 mm - 1000 mm (31.5" - 39.4")			

Benefits of the Carat S system

Sealed, stable, unique

1 Flush with ground level (2 seals)

The Carat S underground tank has numerous seals to effectively stop dirt getting into the tank. This means that seepage water cannot get into the tank and, thus, dirt particles cannot contaminate the rainwater. The seals are in the intersection between the tank and the tank dome and between the tank dome and the telescopic dome shaft. All supply pipes connected to the tank dome are also sealed with five lip seals as standard.

2 Encircling stabilisation ring in unique H profile

The Carat S underground tank has an unique profile for more stability and security. Thanks to the additional ribbing, the Carat S underground tank suffers no significant warping even under extreme loads. Therefore, the Carat S underground tank is suitable for vehicle loading in principle up to a total weight of 3.5 t, groundwater-stable up to the middle of the tank and can be installed with an earth covering up to 1.2 m. Additionally, the encircling H profile acts as a convenient carry handle for transport and as a tread when fitting the tank dome. Please follow our installation instructions for this (can also be downloaded at www.graf.info).

3 Ribbed tank base

The tank base of the Carat S underground tank is extremely stable thanks to the numerous ribs. These enable the Carat S to be installed in groundwater up to the middle of the tank. Furthermore, the stable base means the tank is very robust for transportation to site. The tank base has already proven its excellent rigidity in numerous computer simulations during the development process. Please follow our installation instructions for this purpose (can also be downloaded at www.graf.info).

An overview of further advantages

- Highest stability thanks to modern production methods
- Unique fit accuracy of the components thanks to new production processes
- Consistent quality through TÜV safety testing and production monitoring
- Suitable for vehicle loading (when combined with the telescopic cast iron page 55)
- Groundwater-stable up to the middle of the tank thanks to the extremely stable construction
- Easy to transport due to low weight and encircling H profile
- Investment security thanks to 15-year warranty – compare it!
- Can be expanded as often as required

Tank dome

Tank dome Mini

- Weight: 11 kg
- For especially flat installation
- incl. 3 edge seals

Order no. 371040

Tank dome Maxi

- Weight: 15 kg
- For large earth coverings (loading capacity)
- incl. 5 edge seals

Order no. 371041

Tank dome Micro

- Weight: 7 kg
- including green lid
- for shallow excavation
- earth cover only 90mm

Order no. 371009

Extension for shafts and domes

- Weight: 6 kg
- The earth covering can be raised 300 mm using the spacer.

Order no. 371003

Telescopic dome shaft Mini

- with PE cover
- suitable for pedestrian loading
- Weight: 9 kg
- Adjustable earth covering across upper tank surface

plus 140–340 mm earth covering

Order no. 371010

Telescopic dome shaft Maxi

- with PE cover
- suitable for pedestrian loading
- Weight: 15 kg
- Adjustable earth covering across upper tank surface

plus 140–440 mm earth covering

Order no. 371011

Telescopic dome shaft cast iron

- Suitable for vehicle loading – with childproof cast iron cover up to 3.5 t
- Weight: 55 kg
- Adjustable earth covering across upper tank surface

plus 140–440 mm earth covering

Order no. 371020

Telescopic dome shaft lorry

- Suitable for vehicle/HGV loading
- Weight: 11 kg
- Cover to be provided on site
- Adjustable earth covering across upper tank surface
- For commercially available concrete rings/covers (to be provided on site)

plus 140–440 mm earth covering

Order no. 371021

Wastewater treatment solutions

Prices:

A price list with our export conditions is available on request.

Warranty clause:

The warranty mentioned in this brochure only refers to the tank in question and not to the accessories. Within the warranty period we grant free replacement of the material. Further benefits are excluded. Pre-condition for warranty benefits are proper handling, assembly and installation according to the mounting guidelines.

N.B. Protect tanks from frost when installed above ground! In case of groundwater installation, please contact us for further information prior to purchase!

For all indications of measurements in this brochure we reserve a tolerance of +/- 3%. The usage volume of the tanks may be up to 10% lower than the tank Volume, depending on the connecting option.

Technical modifications and further development of the various products are subject to change. Errors excepted.

For all our offers and conclusions of contract, only our General Terms and Conditions of Business dated 01/03/2010 shall apply, which we will send to you on request.
